	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Load airports and routes from the OpenFlights files ● Build the route graph and calculate distances (haversine) ● Find the best route between two airports (BFS and Dijkstra) ● Load my bucket list and visited list from CSV files ● Score and rank trips with weights I can change ● Simple command-line menu (rank trips, look up a route, mark visited, change weights)	**Schedule - (For V2.0+)** ● Plan a multi-stop trip (nearest-neighbor and 2-opt) ● Travel stats (countries, continents, total distance) ● Map picture of the places I've visited ● Add season dates for sports events ● Show how the ranking changes when weights change
Not Important	**Delegate - (Use a library)** ● Unit testing (use JUnit instead of building my own)	● Website or phone app ● Live flight prices and booking

	• Priority queue for Dijkstra (use Java's built-in PriorityQueue) • Reading and comparing dates (use Java's built-in date classes) • Drawing maps (use an existing map library, if I add maps later)	• User accounts and login • Hotel and rental car planning • Real-time flight delay tracking
